

Water and Climate Update

January 05, 2023

The Natural Resources Conservation Service produces this weekly report using data and products from the [National Water and Climate Center](#) and other agencies. The report focuses on seasonal snowpack, precipitation, temperature, and drought conditions in the U.S.

Snow	2	Drought	10
Precipitation	4	Other Climatic and Water Supply Indicators	14
Temperature.....	8	More Information	20

U.S. West Coast endures another atmospheric river

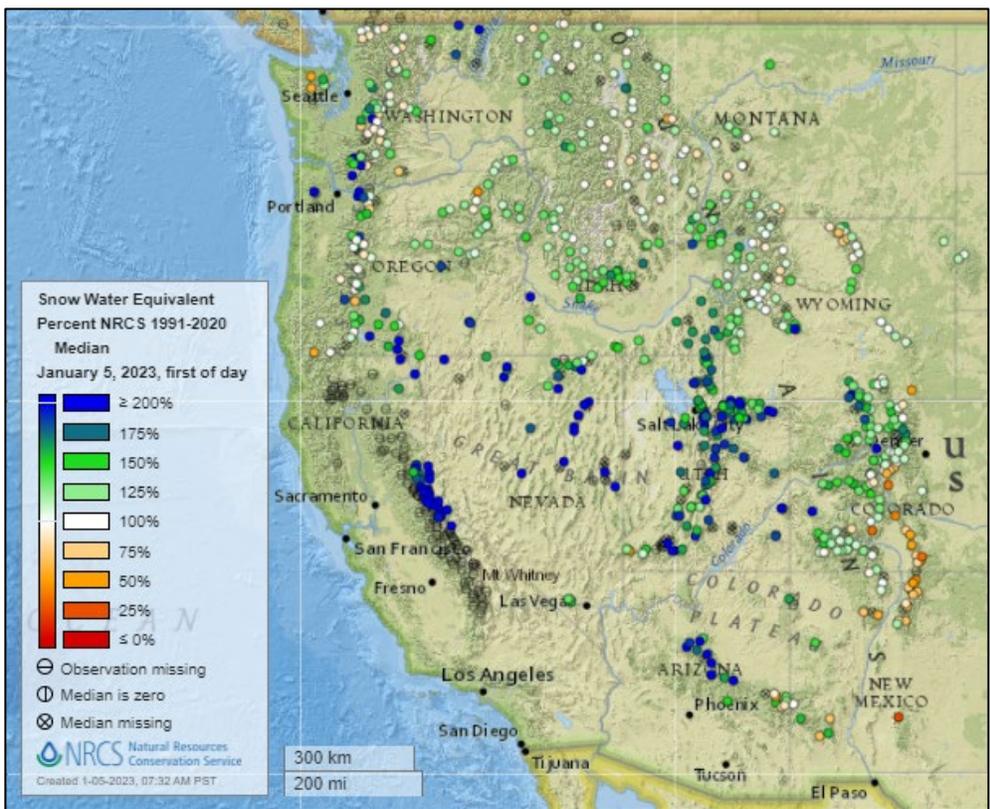

California is faced with another atmospheric river after a brief pause following the previous storm that included excessive lowland flooding and high winds. In anticipation of the impacts expected from the strong storm, Governor Gavin Newsom declared a state of emergency on January 4. Although short-term flooding may not fully result in recovery from long-term drought that has continued to impact California, the storm is expected to leave large amounts of mountain snow, which will increase mountain snowpack and potentially enhance summer water supplies for the region.

Current [National Drought Summary](#), January 03, 2023

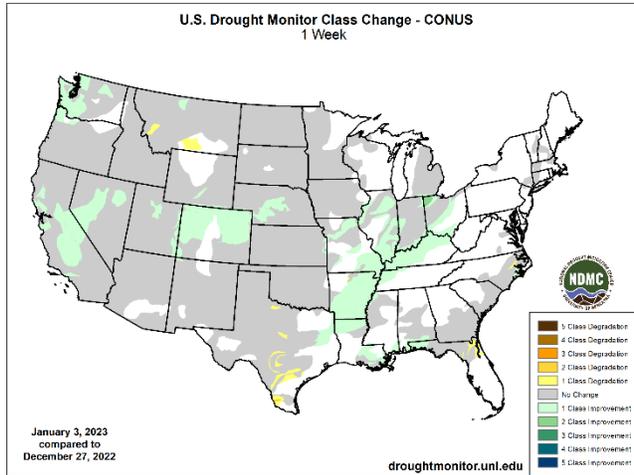

Source: National Drought Mitigation Center

“An atmospheric river (AR) led to heavy rain and high-elevation snow across the West with the largest amounts throughout California on December 30 and 31. Preceding this AR, enhanced onshore flow also resulted in widespread rain and high-elevation snow from the West Coast eastward to the Continental Divide. 7-day total amounts (liquid equivalent), from December 27, 2022 - January 2, 2023, ranged from 2 to 6 inches (locally more) across much of California, western Oregon and Washington, and parts of the Great Basin and central Rockies. A pair of low pressure systems brought widespread, heavy rainfall (1 to 3 inches, locally more) from the lower Mississippi Valley northward to the Ohio Valley. A winter storm affected southern South Dakota and western to central Nebraska where 6 to 18 inches of snowfall occurred on January 2. Mostly dry weather prevailed along most of the East Coast and southern Great Plains. Following the Arctic air outbreak during late December, a rapid warming trend began during the final days of 2022. 5-day temperatures (December 27, 2022 - January 2, 2023) averaged more than 10 degrees F above normal across the central and eastern U.S.”

Daily Mean Soil Moisture vs. Daily Precipitation**

This chart shows the precipitation and soil moisture for the last 30 days at the [Monocline Ridge](#) SCAN site in California. Storm activity on December 27 brought 0.79 inches of precipitation to the station with the -2, -4, and -8-inch soil sensors reporting an increase in soil moisture. Total precipitation for the 30-day period was 2.27 inches.

Agricultural Weather Highlights

Author: Brad Rippey, Agricultural Meteorologist, USDA/OCE/WAOB

National Outlook, Thursday January 05, 2023: “The cold front currently traversing California will move farther inland and weaken, but at least three additional fronts will arrive along the Pacific Coast during the next 5 days. Accordingly, 5-day precipitation totals could reach 5 to 10 inches or more in northern and central California, with lighter amounts expected in other areas of the western U.S. In contrast, dry weather will prevail into early next week across the Plains. During the weekend, rain will return across portions of the South and lower Midwest, with heavier showers (locally 1 to 2 inches or more) possible from the western Gulf Coast region to the Mississippi Delta. The NWS 6- to 10-day outlook for January 10 – 14 calls for above-normal temperatures nearly nationwide, with the greatest likelihood of warmth stretching from the southern Plains to the upper Great Lakes region. Meanwhile, near- or above-normal precipitation across most of the country should contrast with drier-than-normal weather in portions of the northern Plains, Great Lakes region, and south-central U.S.”
